1. Logical View

This view shows the major components of our patient management system. This helps realize all of our functional requirements as it is an overview of the entire system's components.

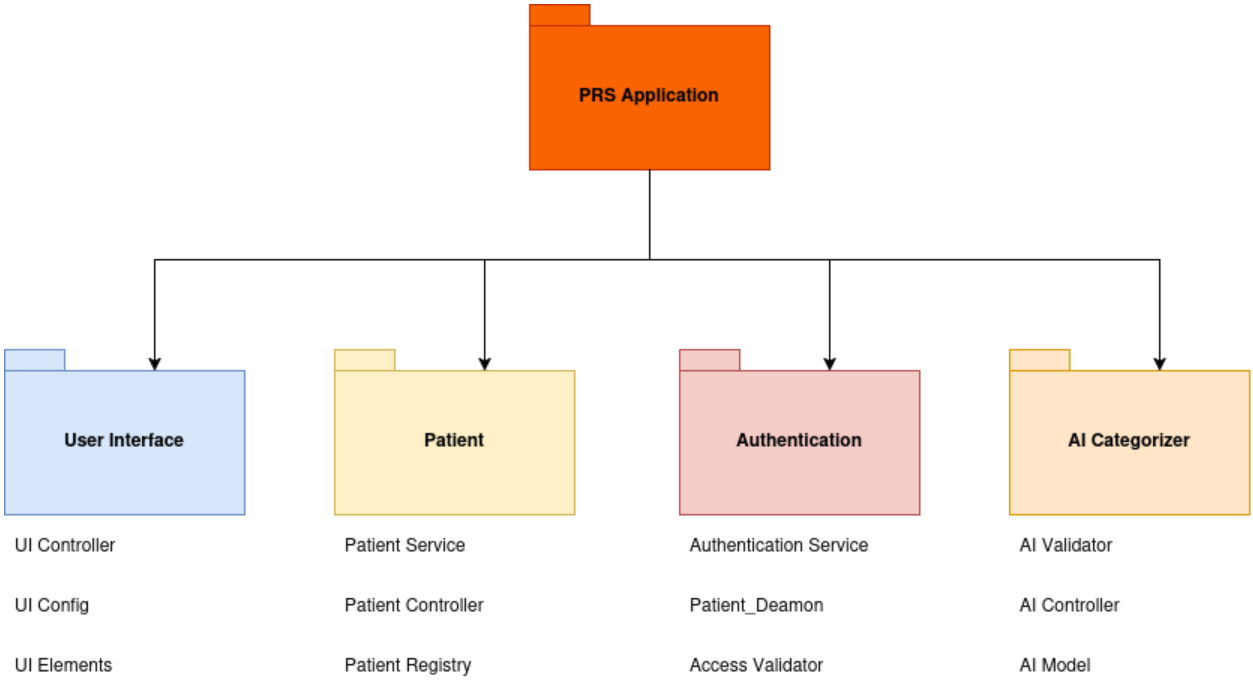

2. Process View

This is the process view graph. It shows the basic flow of auth, AI and notes adding.
Realizes:

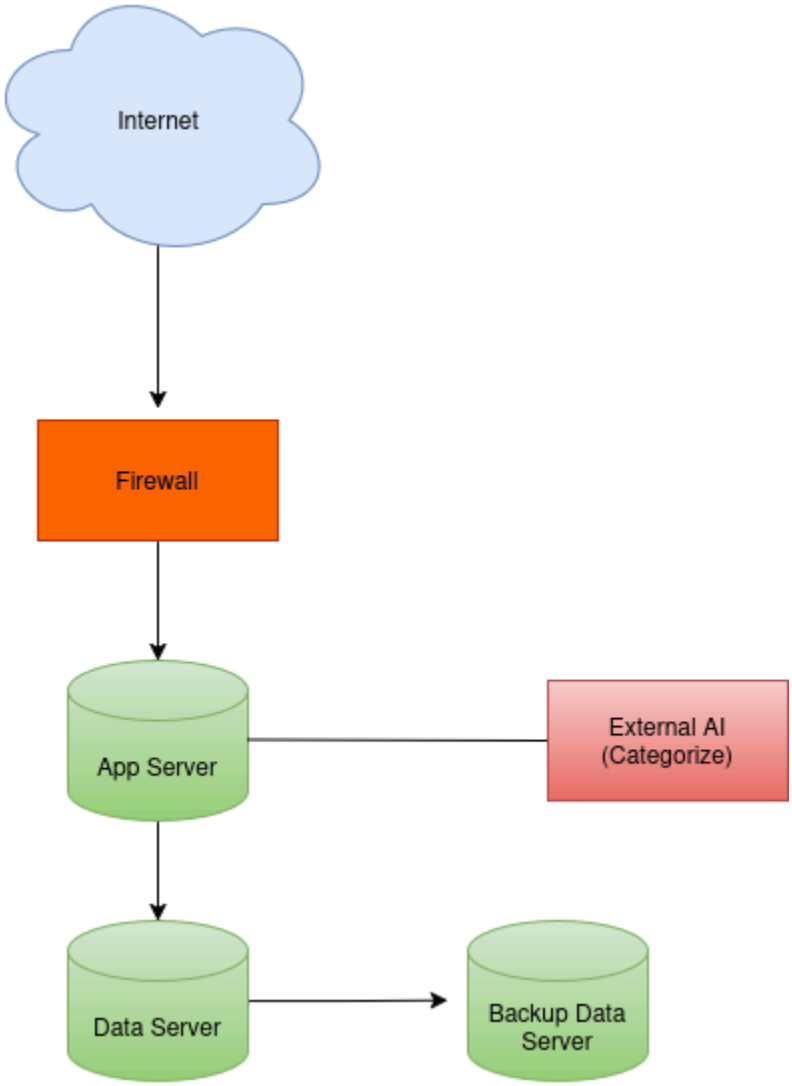

- BR-02: Auth protects client records.
- UR-04: Staff needs to be able to add visit notes.
- AIR-01: AI module should use visit notes and context from the patient to recommend the category for the note.

3. Development View

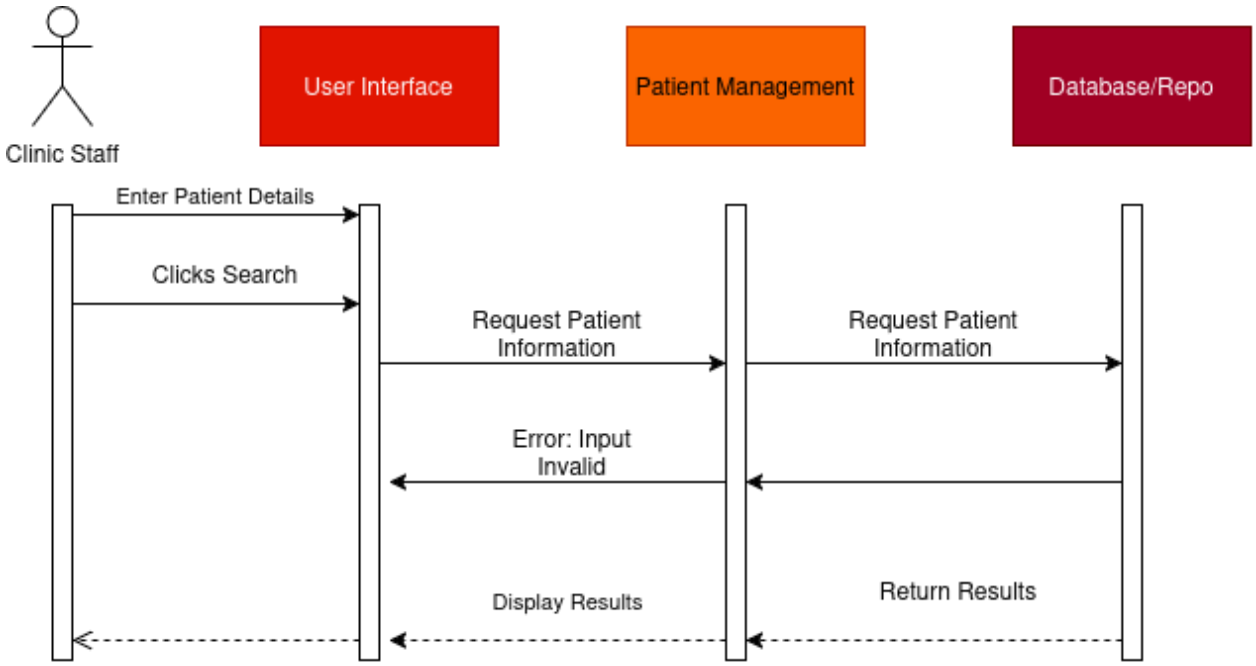

We decided on three smaller components for each folder/ main component. Our main components are User Interface, Patient, Authentication, and AI Categorizer. This helps realize all of the requirements as a complete overview.

4. Physical View

Description: Like any application we first interface through the internet and firewall, we then access the app server. The app server handles data and puts it onto the data server, which is then backed up and cloned periodically for safety. We also have an external AI service that the user can interact with on the app server, which could then potentially aid and influence later data sent to the data server.

5. Sequence View

FR-02

This view shows the scenario and failure case of FR-02. This demonstrates that the functional requirement can be realized in our system.
